

CODE REVIEWS (POWERED BY CLAYTON)

Build secure, scalable solutions that perform

Salesforce is a powerful but complex platform. Building secure and future-proof applications takes time, effort, and expertise. Code Reviews help you maintain the highest standard of code quality and security — catching bad code early, fixing issues at scale, and remediating historical problems automatically.

Comprehensive scanning for everything you build

Analyze every part of your development, from code and Flows to automation and metadata. With coverage across 300+ metadata types — including all Salesforce languages and low-code configuration — you can prevent anti-patterns and make best practices the standard way of working.

Automate code reviews your way

Put your code reviews on autopilot with hundreds of built-in rules aligned to the Salesforce Well-Architected Framework, or customize your own code review criteria to fit your needs.

Security scanning that's always-on

Seamless DevSecOps automation that continuously scans your code against OWASP Top 10 threats and Salesforce-specific misconfigurations. Keep your applications secure with our built-in SAST engine.

Fix and optimize in one click

Resolve vulnerabilities, eliminate anti-patterns, and optimize your code automatically — saving your team hundreds of development hours so they can focus on adding features instead of fixing bugs.

Improve performance and technical debt

Monitor your code health over time, spot training gaps early, and prevent costly tech debt building up. Measure and tackle existing technical debt too.

*We now have defined standards to follow, **saving us a lot of time, increasing our productivity, and eliminating a lot of tech debt with this simple proactive approach.***
